

Graduation Projects Proposals

Contents

1	1. LexiGuard – Legal Contract Risk Agent	16
1.1	1. Project Title	16
1.2	2. Project Idea (Problem)	16
1.3	3. Users	16
1.4	4. Proposed Solution (High-Level)	17
1.5	5. Role of AI	17
	1.5.1 5.1 Why is AI needed?	17
	1.5.2 5.2 What will the AI actually do?	17
1.6	6. Project Scope	17
	1.6.1 6.1 WILL	17
	1.6.2 6.2 WILL NOT	18
1.7	7. Data	18
1.8	8. Team Responsibilities	18
2	2. BuildGuard – Construction Compliance Agent	19
2.1	1. Project Title	19
2.2	2. Project Idea (Problem)	19
2.3	3. Users	19
2.4	4. Proposed Solution (High-Level)	20
2.5	5. Role of AI	20
	2.5.1 5.1 Why is AI needed?	20
	2.5.2 5.2 What will the AI actually do?	20
2.6	6. Project Scope	20
	2.6.1 6.1 WILL	20
	2.6.2 6.2 WILL NOT	21
2.7	7. Data	21
2.8	8. Team Responsibilities	21
3	3. TaxPilot – SME Tax Compliance Agent	22
3.1	1. Project Title	22
3.2	2. Project Idea (Problem)	22

3.3	3. Users	22
3.4	4. Proposed Solution (High-Level)	23
3.5	5. Role of AI	23
3.5.1	5.1 Why is AI needed?	23
3.5.2	5.2 What will the AI actually do?	23
3.6	6. Project Scope	23
3.6.1	6.1 WILL	23
3.6.2	6.2 WILL NOT	24
3.7	7. Data	24
3.8	8. Team Responsibilities	24
4	4. FeasoAI – Business Feasibility Agent	25
4.1	1. Project Title	25
4.2	2. Project Idea (Problem)	25
4.3	3. Users	25
4.4	4. Proposed Solution (High-Level)	26
4.5	5. Role of AI	26
4.5.1	5.1 Why is AI needed?	26
4.5.2	5.2 What will the AI actually do?	26
4.6	6. Project Scope	26
4.6.1	6.1 WILL	26
4.6.2	6.2 WILL NOT	27
4.7	7. Data	27
4.8	8. Team Responsibilities	27
5	5. HireSmart – CV Screening Agent	28
5.1	1. Project Title	28
5.2	2. Project Idea (Problem)	28
5.3	3. Users	28
5.4	4. Proposed Solution (High-Level)	29
5.5	5. Role of AI	29
5.5.1	5.1 Why is AI needed?	29
5.5.2	5.2 What will the AI actually do?	29
5.6	6. Project Scope	29
5.6.1	6.1 WILL	29
5.6.2	6.2 WILL NOT	30
5.7	7. Data	30
5.8	8. Team Responsibilities	30

6	6. ClinicFlow – Medical Triage Agent	31
6.1	1. Project Title	31
6.2	2. Project Idea (Problem)	31
6.3	3. Users	31
6.4	4. Proposed Solution (High-Level)	32
6.5	5. Role of AI	32
	6.5.1 5.1 Why is AI needed?	32
	6.5.2 5.2 What will the AI actually do?	32
6.6	6. Project Scope	32
	6.6.1 6.1 WILL	32
	6.6.2 6.2 WILL NOT	33
6.7	7. Data	33
6.8	8. Team Responsibilities	33
7	7. ScholarMatch – Scholarship Matching Agent	34
7.1	1. Project Title	34
7.2	2. Project Idea (Problem)	34
7.3	3. Users	34
7.4	4. Proposed Solution (High-Level)	35
7.5	5. Role of AI	35
	7.5.1 5.1 Why is AI needed?	35
	7.5.2 5.2 What will the AI actually do?	35
7.6	6. Project Scope	35
	7.6.1 6.1 WILL	35
	7.6.2 6.2 WILL NOT	36
7.7	7. Data	36
7.8	8. Team Responsibilities	36
8	8. RightAssist – Consumer Complaint Agent	37
8.1	1. Project Title	37
8.2	2. Project Idea (Problem)	37
8.3	3. Users	37
8.4	4. Proposed Solution (High-Level)	38
8.5	5. Role of AI	38
	8.5.1 5.1 Why is AI needed?	38
	8.5.2 5.2 What will the AI actually do?	38
8.6	6. Project Scope	38
	8.6.1 6.1 WILL	38
	8.6.2 6.2 WILL NOT	39

8.7	7. Data	39
8.8	8. Team Responsibilities	39
9	9. ProcureWise – Procurement Comparison Agent	40
9.1	1. Project Title	40
9.2	2. Project Idea (Problem)	40
9.3	3. Users	40
9.4	4. Proposed Solution (High-Level)	41
9.5	5. Role of AI	41
9.5.1	5.1 Why is AI needed?	41
9.5.2	5.2 What will the AI actually do?	41
9.6	6. Project Scope	41
9.6.1	6.1 WILL	41
9.6.2	6.2 WILL NOT	42
9.7	7. Data	42
9.8	8. Team Responsibilities	42
10	10. AgriMind – Agricultural Decision Agent	43
10.1	1. Project Title	43
10.2	2. Project Idea (Problem)	43
10.3	3. Users	43
10.4	4. Proposed Solution (High-Level)	44
10.5	5. Role of AI	44
10.5.1	5.1 Why is AI needed?	44
10.5.2	5.2 What will the AI actually do?	44
10.6	6. Project Scope	44
10.6.1	6.1 WILL	44
10.6.2	6.2 WILL NOT	45
10.7	7. Data	45
10.8	8. Team Responsibilities	45
11	11. RealEstateIQ – Real Estate Intelligence Agent	46
11.1	1. Project Title	46
11.2	2. Project Idea (Problem)	46
11.3	3. Users	46
11.4	4. Proposed Solution (High-Level)	47
11.5	5. Role of AI	47
11.5.1	5.1 Why is AI needed?	47
11.5.2	5.2 What will the AI actually do?	47
11.6	6. Project Scope	47

11.6.1	6.1 WILL	47
11.6.2	6.2 WILL NOT	48
11.7	7. Data	48
11.8	8. Team Responsibilities	48
12	12. UniAdvisor – Admission Advisory Agent	49
12.1	1. Project Title	49
12.2	2. Project Idea (Problem)	49
12.3	3. Users	49
12.4	4. Proposed Solution (High-Level)	50
12.5	5. Role of AI	50
12.5.1	5.1 Why is AI needed?	50
12.5.2	5.2 What will the AI actually do?	50
12.6	6. Project Scope	50
12.6.1	6.1 WILL	50
12.6.2	6.2 WILL NOT	51
12.7	7. Data	51
12.8	8. Team Responsibilities	51
13	13. TenderCheck – Public Tender Analysis Agent	52
13.1	1. Project Title	52
13.2	2. Project Idea (Problem)	52
13.3	3. Users	52
13.4	4. Proposed Solution (High-Level)	53
13.5	5. Role of AI	53
13.5.1	5.1 Why is AI needed?	53
13.5.2	5.2 What will the AI actually do?	53
13.6	6. Project Scope	53
13.6.1	6.1 WILL	53
13.6.2	6.2 WILL NOT	54
13.7	7. Data	54
13.8	8. Team Responsibilities	54
14	14. StartupRisk – Startup Risk Scoring Agent	55
14.1	1. Project Title	55
14.2	2. Project Idea (Problem)	55
14.3	3. Users	55
14.4	4. Proposed Solution (High-Level)	56
14.5	5. Role of AI	56
14.5.1	5.1 Why is AI needed?	56

14.5.2	5.2 What will the AI actually do?	56
14.6	6. Project Scope	56
14.6.1	6.1 WILL	56
14.6.2	6.2 WILL NOT	57
14.7	7. Data	57
14.8	8. Team Responsibilities	57
15	15. PolicyScan – Insurance Policy Analyzer	58
15.1	1. Project Title	58
15.2	2. Project Idea (Problem)	58
15.3	3. Users	58
15.4	4. Proposed Solution (High-Level)	59
15.5	5. Role of AI	59
15.5.1	5.1 Why is AI needed?	59
15.5.2	5.2 What will the AI actually do?	59
15.6	6. Project Scope	59
15.6.1	6.1 WILL	59
15.6.2	6.2 WILL NOT	60
15.7	7. Data	60
15.8	8. Team Responsibilities	60
16	16. ExportReady – Export Compliance Agent	61
16.1	1. Project Title	61
16.2	2. Project Idea (Problem)	61
16.3	3. Users	61
16.4	4. Proposed Solution (High-Level)	62
16.5	5. Role of AI	62
16.5.1	5.1 Why is AI needed?	62
16.5.2	5.2 What will the AI actually do?	62
16.6	6. Project Scope	62
16.6.1	6.1 WILL	62
16.6.2	6.2 WILL NOT	63
16.7	7. Data	63
16.8	8. Team Responsibilities	63
17	17. GrantMatch – NGO Grant Matching Agent	64
17.1	1. Project Title	64
17.2	2. Project Idea (Problem)	64
17.3	3. Users	64
17.4	4. Proposed Solution (High-Level)	65

17.5	5. Role of AI	65
17.5.1	5.1 Why is AI needed?	65
17.5.2	5.2 What will the AI actually do?	65
17.6	6. Project Scope	65
17.6.1	6.1 WILL	65
17.6.2	6.2 WILL NOT	66
17.7	7. Data	66
17.8	8. Team Responsibilities	66
18	18. EnergyOpt – Energy Optimization Agent	67
18.1	1. Project Title	67
18.2	2. Project Idea (Problem)	67
18.3	3. Users	67
18.4	4. Proposed Solution (High-Level)	68
18.5	5. Role of AI	68
18.5.1	5.1 Why is AI needed?	68
18.5.2	5.2 What will the AI actually do?	68
18.6	6. Project Scope	68
18.6.1	6.1 WILL	68
18.6.2	6.2 WILL NOT	69
18.7	7. Data	69
18.8	8. Team Responsibilities	69
19	19. FinancePlanner – Personal Finance Agent	70
19.1	1. Project Title	70
19.2	2. Project Idea (Problem)	70
19.3	3. Users	70
19.4	4. Proposed Solution (High-Level)	71
19.5	5. Role of AI	71
19.5.1	5.1 Why is AI needed?	71
19.5.2	5.2 What will the AI actually do?	71
19.6	6. Project Scope	71
19.6.1	6.1 WILL	71
19.6.2	6.2 WILL NOT	72
19.7	7. Data	72
19.8	8. Team Responsibilities	72
20	20. SafetyCheck – Industrial Safety Agent	73
20.1	1. Project Title	73
20.2	2. Project Idea (Problem)	73

20.3	3. Users	73
20.4	4. Proposed Solution (High-Level)	74
20.5	5. Role of AI	74
20.5.1	5.1 Why is AI needed?	74
20.5.2	5.2 What will the AI actually do?	74
20.6	6. Project Scope	74
20.6.1	6.1 WILL	74
20.6.2	6.2 WILL NOT	75
20.7	7. Data	75
20.8	8. Team Responsibilities	75
21	21. TourismInsight – Tourism Intelligence Agent	76
21.1	1. Project Title	76
21.2	2. Project Idea (Problem)	76
21.3	3. Users	76
21.4	4. Proposed Solution (High-Level)	77
21.5	5. Role of AI	77
21.5.1	5.1 Why is AI needed?	77
21.5.2	5.2 What will the AI actually do?	77
21.6	6. Project Scope	77
21.6.1	6.1 WILL	77
21.6.2	6.2 WILL NOT	78
21.7	7. Data	78
21.8	8. Team Responsibilities	78
22	22. JobTrend – Job Market Demand Agent	79
22.1	1. Project Title	79
22.2	2. Project Idea (Problem)	79
22.3	3. Users	79
22.4	4. Proposed Solution (High-Level)	80
22.5	5. Role of AI	80
22.5.1	5.1 Why is AI needed?	80
22.5.2	5.2 What will the AI actually do?	80
22.6	6. Project Scope	80
22.6.1	6.1 WILL	80
22.6.2	6.2 WILL NOT	81
22.7	7. Data	81
22.8	8. Team Responsibilities	81

23	23. PolicyImpact – Public Policy Impact Agent	82
23.1	1. Project Title	82
23.2	2. Project Idea (Problem)	82
23.3	3. Users	82
23.4	4. Proposed Solution (High-Level)	83
23.5	5. Role of AI	83
23.5.1	5.1 Why is AI needed?	83
23.5.2	5.2 What will the AI actually do?	83
23.6	6. Project Scope	83
23.6.1	6.1 WILL	83
23.6.2	6.2 WILL NOT	84
23.7	7. Data	84
23.8	8. Team Responsibilities	84
24	24. CreditGuard – SME Credit Risk Agent	85
24.1	1. Project Title	85
24.2	2. Project Idea (Problem)	85
24.3	3. Users	85
24.4	4. Proposed Solution (High-Level)	86
24.5	5. Role of AI	86
24.5.1	5.1 Why is AI needed?	86
24.5.2	5.2 What will the AI actually do?	86
24.6	6. Project Scope	86
24.6.1	6.1 WILL	86
24.6.2	6.2 WILL NOT	87
24.7	7. Data	87
24.8	8. Team Responsibilities	87
25	25. RouteSmart – Logistics Optimization Agent	88
25.1	1. Project Title	88
25.2	2. Project Idea (Problem)	88
25.3	3. Users	88
25.4	4. Proposed Solution (High-Level)	89
25.5	5. Role of AI	89
25.5.1	5.1 Why is AI needed?	89
25.5.2	5.2 What will the AI actually do?	89
25.6	6. Project Scope	89
25.6.1	6.1 WILL	89
25.6.2	6.2 WILL NOT	90

25.7	7. Data	90
25.8	8. Team Responsibilities	90
26	26. CaseMatch – Court Case Similarity Agent	91
26.1	1. Project Title	91
26.2	2. Project Idea (Problem)	91
26.3	3. Users	91
26.4	4. Proposed Solution (High-Level)	92
26.5	5. Role of AI	92
26.5.1	5.1 Why is AI needed?	92
26.5.2	5.2 What will the AI actually do?	92
26.6	6. Project Scope	92
26.6.1	6.1 WILL	92
26.6.2	6.2 WILL NOT	93
26.7	7. Data	93
26.8	8. Team Responsibilities	93
27	27. EduGap – Curriculum Gap Analyzer	94
27.1	1. Project Title	94
27.2	2. Project Idea (Problem)	94
27.3	3. Users	94
27.4	4. Proposed Solution (High-Level)	95
27.5	5. Role of AI	95
27.5.1	5.1 Why is AI needed?	95
27.5.2	5.2 What will the AI actually do?	95
27.6	6. Project Scope	95
27.6.1	6.1 WILL	95
27.6.2	6.2 WILL NOT	96
27.7	7. Data	96
27.8	8. Team Responsibilities	96
28	28. HealthAlloc – Hospital Allocation Agent	97
28.1	1. Project Title	97
28.2	2. Project Idea (Problem)	97
28.3	3. Users	97
28.4	4. Proposed Solution (High-Level)	98
28.5	5. Role of AI	98
28.5.1	5.1 Why is AI needed?	98
28.5.2	5.2 What will the AI actually do?	98
28.6	6. Project Scope	98

28.6.1	6.1 WILL	98
28.6.2	6.2 WILL NOT	99
28.7	7. Data	99
28.8	8. Team Responsibilities	99
29	29. FoodSafe – Food Safety Compliance Agent	100
29.1	1. Project Title	100
29.2	2. Project Idea (Problem)	100
29.3	3. Users	100
29.4	4. Proposed Solution (High-Level)	101
29.5	5. Role of AI	101
29.5.1	5.1 Why is AI needed?	101
29.5.2	5.2 What will the AI actually do?	101
29.6	6. Project Scope	101
29.6.1	6.1 WILL	101
29.6.2	6.2 WILL NOT	102
29.7	7. Data	102
29.8	8. Team Responsibilities	102
30	30. ImportShield – Import Regulation Agent	103
30.1	1. Project Title	103
30.2	2. Project Idea (Problem)	103
30.3	3. Users	103
30.4	4. Proposed Solution (High-Level)	104
30.5	5. Role of AI	104
30.5.1	5.1 Why is AI needed?	104
30.5.2	5.2 What will the AI actually do?	104
30.6	6. Project Scope	104
30.6.1	6.1 WILL	104
30.6.2	6.2 WILL NOT	105
30.7	7. Data	105
30.8	8. Team Responsibilities	105
31	31. CyberSecure – Cybersecurity Compliance Agent	106
31.1	1. Project Title	106
31.2	2. Project Idea (Problem)	106
31.3	3. Users	106
31.4	4. Proposed Solution (High-Level)	107
31.5	5. Role of AI	107
31.5.1	5.1 Why is AI needed?	107

31.5.2	5.2 What will the AI actually do?	107
31.6	6. Project Scope	107
31.6.1	6.1 WILL	107
31.6.2	6.2 WILL NOT	108
31.7	7. Data	108
31.8	8. Team Responsibilities	108
32	32. TrafficSense – Urban Traffic Analysis Agent	109
32.1	1. Project Title	109
32.2	2. Project Idea (Problem)	109
32.3	3. Users	109
32.4	4. Proposed Solution (High-Level)	110
32.5	5. Role of AI	110
32.5.1	5.1 Why is AI needed?	110
32.5.2	5.2 What will the AI actually do?	110
32.6	6. Project Scope	110
32.6.1	6.1 WILL	110
32.6.2	6.2 WILL NOT	111
32.7	7. Data	111
32.8	8. Team Responsibilities	111
33	33. EnviroScan – Environmental Impact Agent	112
33.1	1. Project Title	112
33.2	2. Project Idea (Problem)	112
33.3	3. Users	112
33.4	4. Proposed Solution (High-Level)	113
33.5	5. Role of AI	113
33.5.1	5.1 Why is AI needed?	113
33.5.2	5.2 What will the AI actually do?	113
33.6	6. Project Scope	113
33.6.1	6.1 WILL	113
33.6.2	6.2 WILL NOT	114
33.7	7. Data	114
33.8	8. Team Responsibilities	114
34	34. SentencingAI – Judicial Pattern Analyzer	115
34.1	1. Project Title	115
34.2	2. Project Idea (Problem)	115
34.3	3. Users	115
34.4	4. Proposed Solution (High-Level)	116

34.5	5. Role of AI	116
34.5.1	5.1 Why is AI needed?	116
34.5.2	5.2 What will the AI actually do?	116
34.6	6. Project Scope	116
34.6.1	6.1 WILL	116
34.6.2	6.2 WILL NOT	117
34.7	7. Data	117
34.8	8. Team Responsibilities	117
35	35. SupplyGuard – Supply Chain Risk Agent	118
35.1	1. Project Title	118
35.2	2. Project Idea (Problem)	118
35.3	3. Users	118
35.4	4. Proposed Solution (High-Level)	119
35.5	5. Role of AI	119
35.5.1	5.1 Why is AI needed?	119
35.5.2	5.2 What will the AI actually do?	119
35.6	6. Project Scope	119
35.6.1	6.1 WILL	119
35.6.2	6.2 WILL NOT	120
35.7	7. Data	120
35.8	8. Team Responsibilities	120
36	36. DueDiligenceAI – Real Estate Due Diligence Agent	121
36.1	1. Project Title	121
36.2	2. Project Idea (Problem)	121
36.3	3. Users	121
36.4	4. Proposed Solution (High-Level)	122
36.5	5. Role of AI	122
36.5.1	5.1 Why is AI needed?	122
36.5.2	5.2 What will the AI actually do?	122
36.6	6. Project Scope	122
36.6.1	6.1 WILL	122
36.6.2	6.2 WILL NOT	123
36.7	7. Data	123
36.8	8. Team Responsibilities	123
37	37. BudgetWatch – Public Budget Transparency Agent	124
37.1	1. Project Title	124
37.2	2. Project Idea (Problem)	124

Chapter 1

1. LexiGuard – Legal Contract Risk Agent

1.1 1. Project Title

LexiGuard – Legal Contract Risk Agent

1.2 2. Project Idea (Problem)

In Egypt, the legal contract analysis sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

1.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

1.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

1.5 5. Role of AI

1.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

1.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

1.6 6. Project Scope

1.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

1.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

1.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

1.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 2

2. BuildGuard – Construction Compliance Agent

2.1 1. Project Title

BuildGuard – Construction Compliance Agent

2.2 2. Project Idea (Problem)

In Egypt, the construction and zoning compliance sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

2.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

2.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

2.5 5. Role of AI

2.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

2.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

2.6 6. Project Scope

2.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

2.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

2.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

2.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 3

3. TaxPilot – SME Tax Compliance Agent

3.1 1. Project Title

TaxPilot – SME Tax Compliance Agent

3.2 2. Project Idea (Problem)

In Egypt, the tax compliance and VAT regulation sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

3.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

3.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

3.5 5. Role of AI

3.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

3.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

3.6 6. Project Scope

3.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

3.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

3.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

3.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 4

4. FeasoAI – Business Feasibility Agent

4.1 1. Project Title

FeasoAI – Business Feasibility Agent

4.2 2. Project Idea (Problem)

In Egypt, the entrepreneurship and feasibility analysis sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

4.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

4.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

4.5 5. Role of AI

4.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

4.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

4.6 6. Project Scope

4.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

4.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

4.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

4.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 5

5. HireSmart – CV Screening Agent

5.1 1. Project Title

HireSmart – CV Screening Agent

5.2 2. Project Idea (Problem)

In Egypt, the human resources recruitment sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

5.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

5.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

5.5 5. Role of AI

5.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

5.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

5.6 6. Project Scope

5.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

5.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

5.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

5.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 6

6. ClinicFlow – Medical Triage Agent

6.1 1. Project Title

ClinicFlow – Medical Triage Agent

6.2 2. Project Idea (Problem)

In Egypt, the medical triage and clinic workflow sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

6.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

6.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

6.5 5. Role of AI

6.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

6.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

6.6 6. Project Scope

6.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

6.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

6.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

6.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 7

7. ScholarMatch – Scholarship Matching Agent

7.1 1. Project Title

ScholarMatch – Scholarship Matching Agent

7.2 2. Project Idea (Problem)

In Egypt, the educational funding access sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

7.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

7.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

7.5 5. Role of AI

7.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

7.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

7.6 6. Project Scope

7.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

7.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

7.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

7.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 8

8. RightAssist – Consumer Complaint Agent

8.1 1. Project Title

RightAssist – Consumer Complaint Agent

8.2 2. Project Idea (Problem)

In Egypt, the consumer protection sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

8.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

8.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

8.5 5. Role of AI

8.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

8.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

8.6 6. Project Scope

8.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

8.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

8.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

8.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 9

9. ProcureWise – Procurement Comparison Agent

9.1 1. Project Title

ProcureWise – Procurement Comparison Agent

9.2 2. Project Idea (Problem)

In Egypt, the supplier evaluation and procurement sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

9.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

9.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

9.5 5. Role of AI

9.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

9.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

9.6 6. Project Scope

9.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

9.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

9.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

9.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 10

10. AgriMind – Agricultural Decision Agent

10.1 1. Project Title

AgriMind – Agricultural Decision Agent

10.2 2. Project Idea (Problem)

In Egypt, the agricultural planning sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

10.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

10.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

10.5 5. Role of AI

10.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

10.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

10.6 6. Project Scope

10.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

10.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

10.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

10.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 11

11. RealEstateIQ – Real Estate Intelligence Agent

11.1 1. Project Title

RealEstateIQ – Real Estate Intelligence Agent

11.2 2. Project Idea (Problem)

In Egypt, the real estate valuation sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

11.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

11.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

11.5 5. Role of AI

11.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

11.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

11.6 6. Project Scope

11.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

11.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

11.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

11.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 12

12. UniAdvisor – Admission Advisory Agent

12.1 1. Project Title

UniAdvisor – Admission Advisory Agent

12.2 2. Project Idea (Problem)

In Egypt, the university admissions sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

12.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

12.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

12.5 5. Role of AI

12.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

12.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

12.6 6. Project Scope

12.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

12.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

12.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

12.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 13

13. TenderCheck – Public Tender Analysis Agent

13.1 1. Project Title

TenderCheck – Public Tender Analysis Agent

13.2 2. Project Idea (Problem)

In Egypt, the government procurement sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

13.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

13.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

13.5 5. Role of AI

13.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

13.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

13.6 6. Project Scope

13.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

13.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

13.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

13.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 14

14. StartupRisk – Startup Risk Scoring Agent

14.1 1. Project Title

StartupRisk – Startup Risk Scoring Agent

14.2 2. Project Idea (Problem)

In Egypt, the startup risk assessment sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

14.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

14.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

14.5 5. Role of AI

14.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

14.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

14.6 6. Project Scope

14.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

14.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

14.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

14.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 15

15. PolicyScan – Insurance Policy Analyzer

15.1 1. Project Title

PolicyScan – Insurance Policy Analyzer

15.2 2. Project Idea (Problem)

In Egypt, the insurance policy evaluation sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

15.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

15.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

15.5 5. Role of AI

15.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

15.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

15.6 6. Project Scope

15.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

15.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

15.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

15.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 16

16. ExportReady – Export Compliance Agent

16.1 1. Project Title

ExportReady – Export Compliance Agent

16.2 2. Project Idea (Problem)

In Egypt, the export regulation compliance sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

16.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

16.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

16.5 5. Role of AI

16.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

16.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

16.6 6. Project Scope

16.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

16.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

16.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

16.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 17

17. GrantMatch – NGO Grant Matching Agent

17.1 1. Project Title

GrantMatch – NGO Grant Matching Agent

17.2 2. Project Idea (Problem)

In Egypt, the grant opportunity matching sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

17.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

17.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

17.5 5. Role of AI

17.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

17.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

17.6 6. Project Scope

17.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

17.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

17.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

17.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 18

18. EnergyOpt – Energy Optimization Agent

18.1 1. Project Title

EnergyOpt – Energy Optimization Agent

18.2 2. Project Idea (Problem)

In Egypt, the energy efficiency optimization sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

18.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

18.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

18.5 5. Role of AI

18.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

18.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

18.6 6. Project Scope

18.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

18.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

18.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

18.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 19

19. FinancePlanner – Personal Finance Agent

19.1 1. Project Title

FinancePlanner – Personal Finance Agent

19.2 2. Project Idea (Problem)

In Egypt, the personal financial planning sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

19.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

19.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

19.5 5. Role of AI

19.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

19.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

19.6 6. Project Scope

19.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

19.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

19.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

19.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 20

20. SafetyCheck – Industrial Safety Agent

20.1 1. Project Title

SafetyCheck – Industrial Safety Agent

20.2 2. Project Idea (Problem)

In Egypt, the industrial safety compliance sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

20.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

20.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

20.5 5. Role of AI

20.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

20.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

20.6 6. Project Scope

20.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

20.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

20.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

20.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 21

21. TourismInsight – Tourism Intelligence Agent

21.1 1. Project Title

TourismInsight – Tourism Intelligence Agent

21.2 2. Project Idea (Problem)

In Egypt, the tourism analytics sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

21.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

21.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

21.5 5. Role of AI

21.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

21.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

21.6 6. Project Scope

21.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

21.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

21.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

21.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 22

22. JobTrend – Job Market Demand Agent

22.1 1. Project Title

JobTrend – Job Market Demand Agent

22.2 2. Project Idea (Problem)

In Egypt, the labor market analysis sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

22.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

22.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

22.5 5. Role of AI

22.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

22.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

22.6 6. Project Scope

22.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

22.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

22.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

22.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 23

23. PolicyImpact – Public Policy Impact Agent

23.1 1. Project Title

PolicyImpact – Public Policy Impact Agent

23.2 2. Project Idea (Problem)

In Egypt, the public policy evaluation sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

23.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

23.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

23.5 5. Role of AI

23.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

23.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

23.6 6. Project Scope

23.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

23.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

23.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

23.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 24

24. CreditGuard – SME Credit Risk Agent

24.1 1. Project Title

CreditGuard – SME Credit Risk Agent

24.2 2. Project Idea (Problem)

In Egypt, the credit risk assessment sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

24.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

24.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

24.5 5. Role of AI

24.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

24.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

24.6 6. Project Scope

24.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

24.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

24.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

24.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 25

25. RouteSmart – Logistics Optimization Agent

25.1 1. Project Title

RouteSmart – Logistics Optimization Agent

25.2 2. Project Idea (Problem)

In Egypt, the logistics route planning sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

25.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

25.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

25.5 5. Role of AI

25.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

25.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

25.6 6. Project Scope

25.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

25.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

25.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

25.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 26

26. CaseMatch – Court Case Similarity Agent

26.1 1. Project Title

CaseMatch – Court Case Similarity Agent

26.2 2. Project Idea (Problem)

In Egypt, the legal case comparison sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

26.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

26.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

26.5 5. Role of AI

26.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

26.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

26.6 6. Project Scope

26.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

26.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

26.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

26.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 27

27. EduGap – Curriculum Gap Analyzer

27.1 1. Project Title

EduGap – Curriculum Gap Analyzer

27.2 2. Project Idea (Problem)

In Egypt, the education curriculum analysis sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

27.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

27.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

27.5 5. Role of AI

27.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

27.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

27.6 6. Project Scope

27.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

27.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

27.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

27.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 28

28. HealthAlloc – Hospital Allocation Agent

28.1 1. Project Title

HealthAlloc – Hospital Allocation Agent

28.2 2. Project Idea (Problem)

In Egypt, the hospital resource planning sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

28.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

28.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

28.5 5. Role of AI

28.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

28.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

28.6 6. Project Scope

28.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

28.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

28.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

28.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 29

29. FoodSafe – Food Safety Compliance Agent

29.1 1. Project Title

FoodSafe – Food Safety Compliance Agent

29.2 2. Project Idea (Problem)

In Egypt, the food safety regulation sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

29.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

29.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

29.5 5. Role of AI

29.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

29.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

29.6 6. Project Scope

29.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

29.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

29.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

29.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 30

30. ImportShield – Import Regulation Agent

30.1 1. Project Title

ImportShield – Import Regulation Agent

30.2 2. Project Idea (Problem)

In Egypt, the import and customs compliance sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

30.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

30.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

30.5 5. Role of AI

30.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

30.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

30.6 6. Project Scope

30.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

30.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

30.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

30.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 31

31. CyberSecure – Cybersecurity Compliance Agent

31.1 1. Project Title

CyberSecure – Cybersecurity Compliance Agent

31.2 2. Project Idea (Problem)

In Egypt, the cybersecurity governance sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

31.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

31.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

31.5 5. Role of AI

31.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

31.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

31.6 6. Project Scope

31.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

31.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

31.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

31.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 32

32. TrafficSense – Urban Traffic Analysis Agent

32.1 1. Project Title

TrafficSense – Urban Traffic Analysis Agent

32.2 2. Project Idea (Problem)

In Egypt, the urban traffic management sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

32.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

32.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

32.5 5. Role of AI

32.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

32.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

32.6 6. Project Scope

32.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

32.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

32.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

32.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 33

33. EnviroScan – Environmental Impact Agent

33.1 1. Project Title

EnviroScan – Environmental Impact Agent

33.2 2. Project Idea (Problem)

In Egypt, the environmental impact assessment sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

33.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

33.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

33.5 5. Role of AI

33.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

33.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

33.6 6. Project Scope

33.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

33.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

33.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

33.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 34

34. SentencingAI – Judicial Pattern Analyzer

34.1 1. Project Title

SentencingAI – Judicial Pattern Analyzer

34.2 2. Project Idea (Problem)

In Egypt, the judicial sentencing analysis sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

34.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

34.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

34.5 5. Role of AI

34.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

34.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

34.6 6. Project Scope

34.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

34.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

34.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

34.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 35

35. SupplyGuard – Supply Chain Risk Agent

35.1 1. Project Title

SupplyGuard – Supply Chain Risk Agent

35.2 2. Project Idea (Problem)

In Egypt, the supply chain risk management sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

35.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

35.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

35.5 5. Role of AI

35.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

35.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

35.6 6. Project Scope

35.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

35.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

35.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

35.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 36

36. DueDiligenceAI – Real Estate Due Diligence Agent

36.1 1. Project Title

DueDiligenceAI – Real Estate Due Diligence Agent

36.2 2. Project Idea (Problem)

In Egypt, the real estate legal due diligence sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

36.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

36.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

36.5 5. Role of AI

36.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

36.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

36.6 6. Project Scope

36.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

36.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

36.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

36.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 37

37. BudgetWatch – Public Budget Transparency Agent

37.1 1. Project Title

BudgetWatch – Public Budget Transparency Agent

37.2 2. Project Idea (Problem)

In Egypt, the public finance transparency sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

37.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

37.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

37.5 5. Role of AI

37.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

37.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

37.6 6. Project Scope

37.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

37.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

37.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

37.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 38

38. RenewPlan – Renewable Energy Feasibility Agent

38.1 1. Project Title

RenewPlan – Renewable Energy Feasibility Agent

38.2 2. Project Idea (Problem)

In Egypt, the renewable energy planning sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

38.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

38.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

38.5 5. Role of AI

38.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

38.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

38.6 6. Project Scope

38.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

38.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

38.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

38.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 39

39. ResearchGrantAI – Research Grant Advisor

39.1 1. Project Title

ResearchGrantAI – Research Grant Advisor

39.2 2. Project Idea (Problem)

In Egypt, the research funding advisory sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

39.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

39.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

39.5 5. Role of AI

39.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

39.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

39.6 6. Project Scope

39.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

39.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

39.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

39.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.

Chapter 40

40. HealthAlert – Public Health Early Warning Agent

40.1 1. Project Title

HealthAlert – Public Health Early Warning Agent

40.2 2. Project Idea (Problem)

In Egypt, the public health monitoring sector faces operational inefficiencies, lack of structured analysis, and manual decision-making processes that lead to measurable financial and operational risks. The problem is observable, repeatable, and affects individuals, SMEs, and institutions.

40.3 3. Users

Primary Users:

- SMEs and professionals in the sector
- Individual decision makers

Secondary Users:

- Analysts and consultants
- Government or regulatory observers

Geographic Focus: Egypt

Language Support: Arabic (Primary), English (Secondary)

40.4 4. Proposed Solution (High-Level)

A full-stack web platform that allows structured input (documents, forms, numeric data, PDFs) and generates intelligent reports, compliance checks, or decision-support insights.

The system:

- Accepts structured and unstructured inputs
- Retrieves relevant regulatory or domain knowledge
- Performs contextual reasoning
- Generates structured analytical reports

40.5 5. Role of AI

40.5.1 5.1 Why is AI needed?

The problem involves contextual interpretation, semantic reasoning, and cross-referencing regulations or domain knowledge. A rule-based or CRUD-only system cannot handle ambiguity and domain complexity.

40.5.2 5.2 What will the AI actually do?

- Use an LLM to understand and analyze user inputs
- Use RAG to retrieve relevant domain documents and regulations
- Use an Agent to:
 - Decide which knowledge sources are applicable
 - Apply contextual reasoning
 - Generate structured decision reports

40.6 6. Project Scope

40.6.1 6.1 WILL

- Analyze user-provided documents or inputs
- Retrieve domain-specific knowledge
- Generate structured analytical reports
- Provide transparent reasoning explanations

40.6.2 6.2 WILL NOT

- Replace licensed professionals
- Issue legally binding decisions
- Guarantee financial or operational outcomes

40.7 7. Data

Data Required:

- Official Egyptian regulatory documents
- Public datasets (CAPMAS, Data.gov.eg, Ministry portals)
- User-uploaded structured documents

Data Acquisition Strategy:

- Download official public documents from government portals
- Convert PDFs into structured searchable format
- Store embeddings in vector database for RAG
- Use user-provided documents as dynamic input data

40.8 8. Team Responsibilities

AI Team: Model selection, prompt engineering, RAG validation.

Backend Team: API development and integration.

Frontend Team: User interface and workflow design.

DevOps Team: Deployment and monitoring.

QA Team: Testing and validation.
