

Smart Egyptian Government Assistant

AI Capstone Project – Idea Proposal

Team 8

1. Project Idea (Problem)

Many Egyptian citizens struggle to understand government procedures such as National ID issuance, Birth Certificate extraction, and Driving License renewal. Information is fragmented and written in complex bureaucratic language.

This leads to repeated office visits, missing documents, time waste, and stress. The problem is observable and affects a large segment of the population.

2. Users

Primary Users: Egyptian citizens, non-technical users, elderly individuals.

Secondary Users: Students and employees.

Geographic Focus: Egypt. **Language:** Arabic (Primary), English (Secondary).

3. Proposed Solution (High-Level)

We will build a web and mobile-accessible AI assistant that allows users to ask natural language questions about selected government procedures.

Main flow: User asks a question → System understands intent → Retrieves relevant official information → Provides structured step-by-step guidance.

MVP covers:

- National ID issuance
- Birth certificate extraction
- Driving license renewal

4. Role of AI

Why AI is needed: Government procedures are unstructured and vary in phrasing. A rule-based system cannot understand natural language questions or interpret documents effectively.

What AI will do:

- Analyze user intent
- Retrieve relevant information from official documents (RAG)
- Generate structured responses
- Clarify ambiguous queries

The system will include LLM integration, Retrieval-Augmented Generation (RAG), and at least one reasoning agent.

5. Project Scope

The Project WILL:

- Provide procedural guidance
- Retrieve answers from official documents
- Deliver structured responses
- Be deployed as a working web application

The Project WILL NOT:

- Submit applications
- Process payments
- Access private citizen data
- Replace government authority

6. Data

The system will use publicly available government procedure documents including required documents lists and official guidelines. No sensitive personal data will be stored.

7. Team Responsibilities

AI Team: Define AI behavior and validate outputs. Backend Team: Develop APIs and integrate AI services. Frontend Team: Implement UI and user flows. Mobile: Ensure responsive access. Testing: Validate functionality and edge cases.
